Abstract

The restructuring of the Australian labour market decreased demand for low-skilled workers and increased demand for highly skilled workers and professionals further strengthening the relationship between educational and occupational attainment. To satisfy the demand for highly educated workers, the government reorganised the higher education sector increasing the number of universities and trebling the number of places for domestic undergraduate students. Analysing data from the Household, Income and Labour Dynamics in Australia survey, this paper examines the association between parents' education and the likelihood of graduating from university for six birth cohorts of Australians. Overall, the findings suggest that although the expansion of the higher education sector in Australia provided alternative pathways into university, differences in educational attainment, on both quantitative and qualitative dimensions, persist.
