Abstract

This paper describes a model for the analysis of the quality of teaching and learning in higher education. Empirically validated through an extensive student-focused survey, this model puts forward a concept of quality that challenges that which is commonly used in institutional analysis. Research indicates that quality, rather than being a simple technical outcome, is a construction responding to the principle of situated action, in which different well-aligned functions exist within certain settings and contexts. The ELQ/AQA08 model proves a valuable evaluation tool for the analysis of teaching and learning practices and offers strong possibilities for the consolidation and improvement of key aspects of these experiences in the context of higher education.
