Abstract

This paper describes the results of a research project that investigated the ways that academics understand sustainability within their own disciplines. It describes a range of ways in which academics view sustainability in the context of their teaching, and a range of ways they suggest that sustainability could be integrated into their teaching. Its genesis was an industry/university forum held at Macquarie University (Australia) that identified the need to integrate ideas of sustainable development within university curricula in all disciplines to prepare students for their professional roles. At a global level, participants in the 2002 Johannesburg Earth Summit emphatically endorsed the proposal that sustainable development needs to be an integral component of all levels of education. Environmental bodies have often focused their attention on development of materials to support sustainable development within specific environmentally focused disciplines. In contrast, the present project acknowledges that issues of sustainability need to span the whole range of subjects and extend to the development of appropriate curriculum. Real change in thinking about sustainability requires creative pedagogy which acknowledges the different ways that people think about
